PacerGo — Scope B Acceptance Evidence & Final Behaviour

NewebPay per-order payments & trainer payout administration (Phase 2 Scope Agreement, Section 4). Companion to the Acceptance Tracker: one section per requirement, with the Definition of Done, the final behaviour as built, and the evidence.

Prepared 29 Oct 2026 **By** Jeriel Layantara (Round Bytes) **For** Aerion Tsai (PacerGo)
Environment app.pacergo.app · Supabase project kezkrcyfnjlugkrcbwmy · NewebPay sandbox merchant **Times** Asia/Taipei (UTC+8)

1. Status at a glance

Item	Requirement	Status	Notes
B-1	Order creation: gross / 5% / 95%, rounding, 30-min expiry	**Ready**	Rounding rule now documented (§3). Expiry applies per payment attempt; see decision D-2.
B-2	Checkout flow	**Accepted**	Verified together earlier.
B-3	Payment confirmation & records	**Accepted**	Verified together earlier.
B-4	Order status views (member / trainer)	**Ready**	Trainer page now shows *when* each order becomes payable.
B-5	Cancellation & refund status	**Ready**	Gap closed: members now see refund status on their bookings.
B-6	Earnings, 24-hour hold, eligibility, withdrawal	**Ready**	Running live since 6 Oct; evidence in §6.
B-7	Admin payout list, filters, totals, access	**Ready**	Rejected and Cancelled are separate filters (D-3).
B-8	Payout detail, workflow, corrections, bank protection	**Ready**	Gap closed: a wrong “Paid” can be undone from the UI; trainer profile link added.
B-9	CSV export	**Ready**	Compare downloads with screens during the walkthrough (§10).
B-10	Live NewebPay cutover	**Contingent (M4)**	Waits on P-2 / P-3 / P-4.

Release status on 29 Oct 2026. Everything in this document is implemented and tested in the codebase. The 29 Oct additions (member refund status, payout-timing information, undo-Paid, trainer profile link, rounding-rule documentation) are being deployed together with three updated database functions; the walkthrough in §10 should be run after that deployment. Everything else has been live since 6–26 Oct.

2. The settlement flow everyone sees

Paid
Member pays the order (NewebPay). Record stores gross, 5% fee, 95% payable.

→

Service completed
Automatic when the session end time passes (checked every 15 min). Admin can correct with a reason.

→

24-hour hold
Starts at completion. Amount is *not* in the trainer's balance yet.

→

Eligible for payout
Automatic after the hold if paid, not cancelled, not refunded, no admin hold. Added to available balance.

→

Withdrawal
Trainer requests up to the balance. Admin: Requested → Processing → Paid (manual bank transfer).

The same timeline is now written into the product so nobody has to remember it: the trainer's Earnings page has a “How payouts work” card and a per-order line such as “Service completed · eligible for payout from 27 Oct 11:00”, the balance card shows how much is still inside the 24-hour hold and when the next amount is released, the admin order page shows “Payout eligible from …”, and the admin payouts page states the balance rule under its title.

3. B-1 · Order creation from booking

Definition of Done. Order record contains correct gross / 5% fee / 95% payable amounts for the agreed test prices (rounding rule documented); an unpaid order expires after 30 minutes and its slot becomes bookable again.

Final behaviour. When a member starts checkout on an accepted booking, a payment record is created from the booking's agreed price. One database function, `compute_order_fee_split`, computes the split and every caller reads its result.

> **Rounding rule (documented 29 Oct 2026).** Platform fee = 5% of the gross amount, rounded **half up to a whole NTD**. Trainer payable = gross – fee, so fee + payable always equals the gross. Examples: NT$400 → 20 / 380 · NT$500 → 25 / 475 · NT$600 → 30 / 570 · NT$410 → 21 / 389 (20.5 rounds up). NewebPay's processing fee is absorbed from the platform's 5% and never deducted from the trainer's 95%. *Please confirm or object to this rule; it is a one-line change in one function.*

Evidence. Every paid payment on the live project splits exactly 5% / 95% and sums back to the gross (checked across all rows on 29 Oct). Unpaid attempts expire by cron every 5 minutes: 20 minutes for an attempt the member has not finished (NewebPay's own page closes at 15), 30 minutes while a payment is processing, and NewebPay's printed deadline for ATM / convenience-store / barcode orders.

Decision D-2 for your confirmation. Since the retryable-checkout change in late October, the 30-minute rule expires the *payment attempt*; the booking goes back to "Pending payment" so the member can pay again, and the booking itself expires only when its session time passes (or after 7 days if it has no time). Bookings never reserve a time slot in PacerGo: a trainer accepts requests manually and the only guard is one open booking per member–trainer pair, so another member is never blocked by an unpaid order.

4. B-4 · Order status views

Definition of Done. Each role sees exactly its own orders with correct amounts and statuses; access enforced server-side.

Role	Where	What is shown
Member	Me → Sessions (/sessions) and booking detail	Own bookings only, amount, booking/payment state (Pending payment · Payment processing · Payment failed · Confirmed · Completed · Cancelled · Expired) and, new, a refund tag (Refund requested / Refunded) with a one-line explanation.
Trainer	Studio → Earnings (/studio/earnings)	Own orders only: payable amount (95%), eligibility badge (Pending hold / Eligible / Settled), refund tag, and the new timing line stating when the order becomes payable. Available balance, amount still in hold with next release time, withdrawal history.
Admin	Admin → Orders	All orders with fee split, refund, service completion, hold, eligibility and settlement, plus the new "Payout eligible from" row and history.

Evidence. All reads go through SECURITY DEFINER database functions scoped to the signed-in user (my_bookings, booking_detail, trainer_orders, my_trainer_balance); row-level security additionally limits direct table reads to the member's own payments and the trainer's own bookings. Clients have no table write privileges at all.

5. B-5 · Cancellation & refund status recording

Definition of Done. Admin can move an order through the cancellation/refund statuses; the user-facing and trainer-facing views reflect the current status; cancelled and refunded orders are excluded from settlement eligibility and from trainer available balance.

Final behaviour. On an order, an admin can: **Issue refund** (flags "refund requested" with the admin's reason and, for card payments, returns the money through NewebPay immediately — a charge not yet captured is voided, a captured one refunded; other methods stay "refund requested" for a portal refund), **Mark refunded**, **Cancel** (unpaid orders), **Hold / Release** (dispute flag), and correct service completion. Every action requires a reason and is written to the order's history with the admin's identity and time. A trainer cancelling a paid booking also flags the refund automatically. Any of these takes the order out of eligibility at once; the 15-minute cycle re-checks as a safety net.

Visibility. Trainer: refund tag on the order. Member (new): “Refund requested” / “Refunded” tag beside the booking status on the list and detail, with a note that the amount returns to the original payment method. Admin: refund status, hold and history.

Evidence (live, 29 Oct). Order history contains 4 trainer-cancel refund flags, 2 NewebPay refunds completed automatically, 1 admin refund-status change and 1 admin correction of service completion, each with actor and reason. Refunded and cancelled payments carry “ineligible” and are not counted by the balance function.

6. B-6 · Trainer earnings, settlement eligibility & withdrawal request

Definition of Done (agreed test scenarios) and how each is met:

Scenario	Behaviour and evidence
Session end time passes → order automatically Service Completed	Cron job run-settlement-cycle every 15 minutes (active, last run succeeded 29 Oct 12:00). 10 automatic completions recorded on live orders; the booking is completed at the same moment.
During the 24-hour hold the amount is not in the available balance	Completion stamps settlement_hold_until = completion + 24 h; the balance only sums orders already marked eligible. Live rows: completed 26 Oct 11:00 → hold until 27 Oct 11:00.
After the hold the amount is added automatically if paid and no cancellation / refund / dispute / hold	The same cycle marks eligibility only when all conditions hold; three live orders moved to eligible this way on 27 Oct.
Cancelled, refunded, disputed or held orders never count	Excluded by the eligibility conditions, downgraded immediately by the admin actions, and revoked by the cycle if a condition changes later.
Admin corrects service completion → balance updates, correction logged with reason and identity	admin_correct_service_completed requires a reason; reverting removes eligibility at once, re-completing starts a fresh 24-hour hold. One live correction recorded on 6 Oct with reason and admin id.
Balance always matches the order records	The balance is computed from the orders on every read, never stored. Available balance also nets out withdrawals still Requested or Processing, so the same money cannot be requested twice.
Withdrawal above balance rejected with a clear error	Server raises insufficient_balance; the page shows “That amount is higher than your available balance” and caps the input. A request without a saved bank account is refused too.
Submitted request appears in the admin list immediately	Same table, read live. Live example: requested 6 Oct 12:14, admin moved it to Processing at 12:23.

Testing note. Payments made with the built-in simulated provider never become payout-eligible (nobody is owed money for a test payment), so B-6 scenarios must be run with NewebPay sandbox cards on app.pacergo.app.

7. B-7 · Admin payout dashboard — list

Definition of Done. List shows all requests with correct data; each filter returns exactly the matching rows; totals equal the sum of the filtered rows; account numbers masked; non-admins blocked server-side.

Final behaviour. Admin → Payouts (/admin/payouts) lists request date, trainer, amount, masked account (last four digits), status and last update, with name search and paging. Filters: All · Requested · Processing · Paid · Rejected · Cancelled. Header cards show count and sum of Requested, of Processing and of Paid, computed server-side over all requests of that status. The balance rule is printed under the page title.

Evidence. The list function returns only the mask, never the number. Non-admins get a 404 for the whole admin area and “forbidden” from every admin function (the check is inside the database, not the browser). 19 automated UI tests cover filters, totals, search, paging and the action menu.

Decision D-3. Rejected and Cancelled are offered as two filters rather than one combined “Rejected-Cancelled”, so it stays visible which of the two happened.

8. B-8 · Admin payout detail, status workflow & corrections

Definition of Done. Valid transitions (incl. Rejected/Cancelled and corrections) available in the UI with required reason notes; every change logged with time, admin identity and reason, history visible; full bank details only in the admin detail view; bank details absent from logs.

Final behaviour. Opening a request shows the trainer (with a link to their profile), amount, bank code / bank / branch / holder, the account number masked with a **Show** button that decrypts it on the server for that admin only, request time, and the full status history (from → to, admin name, time, reason). Transitions: Requested → Processing → Paid (no reason needed); Reject / Cancel from Requested or Processing (reason required); corrections Processing → Requested, Rejected/Cancelled → Requested and, new, Paid → Processing (reason required). Marking Paid settles the orders the amount covers (oldest completed first); reverting from Paid un-settles exactly those orders.

Evidence (live). Request of NT$400 (account ••••2676): Requested 6 Oct 12:14 → Processing 12:23 (“Will be in your bank account in 1 hour”) → corrected back to Requested 12:29 (“Wait a minute”) → Processing 12:48 → Paid 12:48 (“Paid”); five audit rows with the admin's id. Bank numbers are stored encrypted (AES-GCM, key only on the server); the reveal endpoint logs only “admin X revealed user Y”, and an automated test asserts the number never appears in log output. CSV exports and the list carry the mask only.

9. B-9 · CSV export

Definition of Done. Each export downloads with the listed columns and matches the on-screen data; no full bank account numbers appear.

Export	Columns
Users	Display name, home area, experience level, primary activity, profile level, profile setup status/time, signup source, created at. *No email, bank or device data.*
Trainers	Display name, home area, experience level, tier, price NTD, rating average/count, created at.
Orders	Created/paid at, member, trainer, activity, tier, scheduled start, duration, location, agreed price, merchant order no., provider trade no., provider, provider type, **gross amount, platform fee rate/amount, processing fee rate/amount, trainer payable, payment status, refund status, service completed at, settlement hold until, settlement eligibility, settlement status**, failed/expired at.
Withdrawals	Requested/settled/updated at, trainer, amount, **bank account (masked)**, status, reason note.

Evidence. Downloads are admin-gated twice (page and API route; 403 for non-admins, 404 for unknown resources), served with no-store, and the server logs only the resource name and row count. 27 unit tests cover CSV escaping, masking (last four only) and the exact column sets. Processing-fee columns are blank until a provider reports the fee; NewebPay does not include it in its notification. Six failed or expired attempts from July, before the fee split existed, show a zero fee; they were never paid.

10. Suggested joint walkthrough (about 45 minutes)

Step	Do	Expect
B-1	Book a NT$410 (or any) offering as a member; trainer accepts; pay with sandbox card 4000-2211-1111-1111.	Admin → Orders shows gross 410, fee 21, payable 389. Start a second checkout and abandon it: after 20 min it shows Expired and the booking is “Pending payment” again.
B-4	Open Sessions as the member; Earnings as the trainer.	Each sees only their own orders. Trainer line reads “Session ends … · eligible after the 24 h hold, about …”.
B-6	Wait for the booked end time (book a session 10 min ahead).	Within 15 min the order shows “Service completed · eligible for payout from <end + 24 h>”; balance unchanged; “In 24 h hold: NT$389”. Next day: balance NT$389, line “Eligible for payout since …”. Request NT$500 → clear error; request NT$389 → appears in Admin → Payouts at once.
B-5	Admin → Orders → Issue refund on a paid card order with a reason.	Order: Refund requested → Refunded (NewebPay void/refund); member's booking shows the refund tag; trainer's order shows “Refunded”; amount leaves eligibility.
B-7	Switch the status filters; search a name; sign in as a non-admin and open /admin/payouts.	Rows match each filter; totals match; non-admin gets “not found”.
B-8	Mark Processing → Paid; then “Revert to Processing (undo Paid)” with a reason; press Show on the account number.	History shows every step with admin name, time and reason; orders settle and un-settle; full number appears only after Show.
B-9	Download the four CSVs.	Columns as in §9; figures equal the screens; withdrawals show ••••2676-style masks only.

11. Decisions recorded for client confirmation

• **D-1 Rounding.** 5% rounded half up to whole NTD; payable = gross – fee (§3).

• **D-2 Expiry.** The 30-minute window expires the payment attempt; the booking stays payable until its session time. No time-slot reservation exists in PacerGo (§3).

• **D-3 Filters.** Rejected and Cancelled are separate filters (§7).

• **D-4 Settlement mapping.** Marking a withdrawal Paid settles whole orders, oldest completed first, until the amount is covered; the join table records which orders, so an undo reverses exactly those (§8).

• **D-5 Test payments.** Simulated-provider payments are never payout-eligible; use sandbox cards for settlement tests (§6).

12. Verification record

• Live database inspected 29 Oct 2026: fee arithmetic on all payments; cron jobs and last runs; order and withdrawal history; function grants (cron-only functions not callable by users; admin functions gated inside the database); row-level security on payments, withdrawal and event tables.

• Automated tests: 227 web tests across the admin, studio (earnings), booking, home and export suites; 342 shared-package tests; TypeScript typecheck clean.

• Source references: backend/migrations/20261008000001_init.sql (functions named above), apps/web/src/features/studio/earnings-view.tsx, apps/web/src/features/admin/ (payouts, orders), apps/web/src/lib/export/, docs/phase2-work-tracker.md (decisions log).
